**EP 1 122 243 A1**

**Description**Field of the invention.

**[0001]** The present invention relates to a new series of imidazoles with anti-inflammatory activity, as well as to a process for their preparation, to the pharmaceutical compositions that contain these compounds and to their use in medicine.

Background of the invention.

**[0002]** In many acute as well as chronic inflammatory processes, substances derived from the metabolism of arachidonic acid are involved. These form a large family of compounds of lipidic nature that are the result of the action of a series of enzymes which form what is called the arachidonic acid cascade. The most important one from the therapeutic point of view is prostaglandin G/H synthase (PGHS), also known as cyclooxygenase (COX), which catalyzes the formation of vasoactive and inflammatory substances such as prostaglandins (PGE<sub>2</sub>, PGD<sub>2</sub>, PGF<sub>2</sub>), prostacyclin (PGI<sub>2</sub>) and thromboxane A<sub>2</sub> (TXA<sub>2</sub>).

**[0003]** Inhibition of cyclooxygenase (COX) is the mechanism of action responsible for the effect of most anti-inflammatory drugs that are on the market (non-steroidal anti-inflammatory drugs, NSAIDs). Said inhibition also reduces the levels of prostaglandins at gastric level, which, taking into account the protective role of said molecules on the gastric mucosa, has been correlated to the well known gastric effects of NSAIDs.

**[0004]** At the beginning of the 90's two cyclooxygenase isoforms, COX-1 and COX-2, were described. COX-1 is the constitutive isoform, present in many tissues, but preferentially in the stomach, kidney and platelets. Its inhibition is responsible for the gastric and renal effects of NSAIDs. On the other hand, COX-2 is an inducible isoform, which is expressed as a consequence of an inflammatory or mitogenic stimulus in a wide range of tissues such as macrophages, chondrocytes, fibroblasts and endothelial cells.

**[0005]** The discovery of the inducible isoenzyme of PGHS (PGHS<sub>2</sub> or COX-2) has allowed the synthesis of selective COX-2 inhibitors which presumably improve the gastric tolerance of these drugs, since as they inhibit the constitutive form present in the stomach to a lesser extent, they exhibit reduced ulcerogenic potency (one of the most characteristic side effects of non-selective inhibitors). The present invention describes new cyclooxygenase inhibitors with selectivity for the isoform 2 (COX-2).

**[0029]** In the above definitions, the term C<sub>1-8</sub> alkyl, as a group or a part of a group, means a lineal or branched alkyl group containing from 1 to 8 carbon atoms. Examples include among others methyl, ethyl, propyl, isopropyl, butyl, isobutyl, *sec*-butyl, *tert*-butyl, pentyl, isopentyl, neopentyl, hexyl, heptyl and octyl. **[0031]** A C<sub>1-8</sub> haloalkyl group means a group resulting from the substitution of one or more hydrogen atoms of a C<sub>1-8</sub> alkyl group with one or more halogen atoms (that is, fluoro, chloro, bromo or iodo), which can be the same or different. **[0033]** In the definition of R<sub>2</sub> the term aryl means phenyl or naphthyl. The term heteroaryl in the definition of R<sub>2</sub> means a pyridine, pyrazine, pyrimidine or pyridazine ring, which can be optionally fused to a benzene ring, thus giving rise to a quinoline, isoquinoline, quinoxaline, quinazoline, phthalazine, or cinnoline ring. The heteroaryl group can be linked to the rest of the molecule of formula I through any carbon atom in any of the rings (in case it contains a fused benzene ring).

**[0034]** As it has already been mentioned above, the aryl or heteroaryl group represented by R<sub>2</sub> can be optionally substituted with one or more, preferably from one to three, groups independently selected from halogen, C<sub>1-8</sub> alkyl, C<sub>1-8</sub> haloalkyl, R<sub>4</sub>OC<sub>0-8</sub> alkyl, R<sub>4</sub>SC<sub>0-8</sub> alkyl, cyano, nitro, -NR<sub>4</sub>R<sub>6</sub>, -NR<sub>4</sub>SO<sub>2</sub>R<sub>5</sub>, -SOR<sub>5</sub>, -SO<sub>2</sub>R<sub>5</sub>, -SO<sub>2</sub>NR<sub>4</sub>R<sub>6</sub> or -CONR<sub>4</sub>R<sub>6</sub>. The substituent(s), when there are more than one, can be in any available position of the aryl or heteroaryl group.

**[0035]** Although the present invention includes all the compounds above mentioned, those compounds of formula I are preferred wherein, independently or in any compatible combination:

R<sub>2</sub> represents phenyl or pyridine optionally substituted with one or more groups independently selected from halogen, C<sub>1-8</sub> alkyl, C<sub>1-8</sub> haloalkyl, R<sub>4</sub>OC<sub>0-8</sub> alkyl, R<sub>4</sub>SC<sub>0-8</sub> alkyl, cyano, nitro, -NR<sub>4</sub>R<sub>6</sub>, -NR<sub>4</sub>SO<sub>2</sub>R<sub>5</sub>, -SOR<sub>5</sub>, -SO<sub>2</sub>R<sub>5</sub>, -SO<sub>2</sub>NR<sub>4</sub>R<sub>6</sub>, or -CONR<sub>4</sub>R<sub>6</sub>; and/or

R<sub>3</sub> represents methyl or -NH<sub>2</sub>; and/or

**[0040]** Another particularly preferred class of compounds of the present invention are those compounds of formula I wherein R<sub>3</sub> represents methyl or -NH<sub>2</sub>, R<sub>1</sub> represents chloro, X represents N, and R<sub>2</sub> represents phenyl or pyridine optionally substituted with one or more groups independently selected from halogen, C<sub>1-8</sub> alkyl, C<sub>1-8</sub> haloalkyl, R<sub>4</sub>OC<sub>0-8</sub> alkyl, R<sub>4</sub>SC<sub>0-8</sub> alkyl, cyano, nitro, -NR<sub>4</sub>R<sub>6</sub>, -NR<sub>4</sub>SO<sub>2</sub>R<sub>5</sub>, -SOR<sub>5</sub>, -SO<sub>2</sub>R<sub>5</sub>, -SO<sub>2</sub>NR<sub>4</sub>R<sub>6</sub>, or -CONR<sub>4</sub>R<sub>6</sub>.

**[0041]** The compounds of the present invention contain one or more basic nitrogens and, consequently, they can form salts with organic and inorganic acids, which are also included in the present invention. There is no limitation on the nature of said salts, provided that, when used for therapeutic purposes, they are pharmaceutically acceptable. Examples of said salts include salts with inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, nitric acid, perchloric acid, sulfuric acid or phosphoric acid; and salts with organic acids, such as methanesulfonic acid, trifluoromethanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, *p*-toluenesulfonic acid, fumaric acid, oxalic acid, acetic acid or maleic acid, among others. The salts can be prepared by treatment of a compound of formula I

with a sufficient amount of the desired acid to give the salt in a conventional manner. The compounds of formula I and their salts differ in certain physical properties, such as solubility, but they are equivalent for the purposes of the invention.

[0042] Some compounds of the present invention can exist in solvated form, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable solvents such as water, ethanol and the like, are equivalent to the unsolvated form for the purposes of the invention.

[0043] Some compounds of the present invention can exist as various diastereoisomers and/or various optical isomers. Diastereoisomers can be separated by conventional techniques such as chromatography or fractional crystallization. The optical isomers can be resolved using conventional techniques of optical resolution, to give the optically pure isomers. This resolution can be performed upon any synthetic intermediate is chiral or upon the products of general formula I. The optically pure isomers can also be individually obtained using enantiospecific synthesis. The present invention covers both the individual isomers and the mixtures (for example racemic mixtures), whether obtained by synthesis or by physically mixing them up.

[0044] Furthermore, some of the compounds of the present invention can exhibit cis/trans isomery. The present invention includes each one of the geometric isomers as well as the mixtures thereof.

[0045] It is also an object of the present invention to provide a process for preparing the compounds of formula I. As will be obvious to a person skilled in the art, the precise method used for the preparation of a given compound can vary depending on its chemical structure. Furthermore, in most processes that are detailed below it may be necessary or appropriate to protect the labile or reactive groups using conventional protecting groups. Both the nature of said protecting groups and the processes for their introduction and removal are well known and belong to the state of the art (see for example Greene T.W., "Protective Groups in Organic Synthesis", John Wiley & Sons, New York, 1981).

[0046] The compounds of formula I wherein  $R_1$  represents hydrogen or methyl are in general obtained by reacting an imine of formula II with an isocyanide of formula III, as shown in the following scheme:

wherein  $R_1$  represents hydrogen or methyl, X, Y,  $R_2$  and  $R_3$  have the meaning described above, and L represents a good leaving group such as tosyl or 1H-benzotriazol-1-yl.

[0047] This reaction is carried out in the presence of a base such as  $\text{K}_2\text{CO}_3$  in a suitable solvent such as methanol-dimethoxyethane mixtures, and heating, preferably at reflux.

[0048] The imines of formula II can be prepared by condensation of an aldehyde of formula  $\text{R}_2\text{-CHO}$  (IV) with an amine of formula  $\text{R}_3\text{SO}_2\text{-C}_6\text{H}_4\text{-NH}_2$  (V) when X is N or by condensation of an aldehyde of formula  $\text{R}_3\text{SO}_2\text{-C}_6\text{H}_4\text{-CHO}$  (VI) with an amine of formula  $\text{R}_2\text{-NH}_2$  (VII) when Y is N, heating at reflux in a suitable solvent such as benzene or toluene in a Dean Stark.

[0049] The isocyanides of formula III are commercially available such as tosylmethylisocyanide and 1H-benzotriazol-1-ylmethylisocyanide or can be prepared by alkylation of these with methyl iodide using the method described in the literature (A.M. van Leusen *et al.*, *Tetrahedron Lett.* **1975**, 3487-88).

[0050] A compound of formula I wherein  $R_3$  represents  $\text{C}_{1-8}$  alkyl or  $\text{C}_{1-8}$  haloalkyl can also be prepared from the corresponding thioether of formula VIII

15 wherein  $R_3$  represents  $C_{1-8}$  alkyl or  $C_{1-8}$  haloalkyl and X, Y,  $R_1$  and  $R_2$  have the meaning described above, by oxidation with a suitable oxidizing agent such as m-chloroperbenzoic acid, magnesium monoperoxyphthalate or Oxone® in a suitable solvent such as a halogenated hydrocarbon, for example dichloromethane.

20 **[0051]** A compound of formula I wherein  $R_3$  represents  $-NH_2$  can also be prepared from the corresponding sodium sulfinate of formula IX,

35 wherein X, Y,  $R_1$  and  $R_2$  have the meaning described above, by reaction with hydroxylamine-O-sulfonic acid in a suitable solvent such as water or water-tetrahydrofuran mixtures.

40 **[0052]** The compounds of formula IX are prepared from the corresponding methylsulfoxide X, that is a compound analogous to IX but with a  $-SOCH_3$  group instead of  $-SO_2Na$ , by a process that involves treatment with acetic anhydride to give the corresponding acetoxymethylthio derivative ( $-SCH_2OAc$ ), which is oxidized with a suitable oxidizing agent such as magnesium monoperoxyphthalate to give the derivative  $-SO_2CH_2OAc$ , which is converted into a sodium sulfinate of formula IX by treatment with a base, for example sodium hydroxide.

**[0053]** A compound of formula I wherein  $R_3$  represents  $-NR_4R_6$  can also be prepared from a chlorosulfonyl derivative of formula XI

wherein X, Y, R<sub>1</sub> and R<sub>2</sub> have the meaning described above, by reaction with an amine of formula HNR<sub>4</sub>R<sub>6</sub> (XII). The compounds of formula XI can be prepared from a sodium sulfinate of formula IX by chlorination with thionyl chloride. Alternatively, a compound of formula XI can be prepared from a compound of formula XIII

wherein X, Y, R<sub>1</sub> and R<sub>2</sub> have the meaning described above, by treatment with a halosulfonic acid, for example chlorosulfonic acid.

**[0054]** The compounds VIII, X and XIII can be prepared following the same general method described above for preparing compounds of formula I but starting from compounds II which contain a -SR<sub>3</sub>, -SOCH<sub>3</sub> or -H group, respectively, instead of -SO<sub>2</sub>R<sub>3</sub>. The derivatives X can also be prepared from a compound of formula VIII wherein R<sub>3</sub> = CH<sub>3</sub> by oxidation with a suitable oxidizing agent.

**[0055]** Some compounds of formula I can also be obtained by interconversion from another compound of formula I, in one or a plurality of steps, using standard reactions in organic chemistry.

**[0056]** Thus, for example, a substituent R<sub>1</sub> can be transformed into another R<sub>1</sub> group, thus generating new compounds of formula I.

**[0057]** Many of the compounds of formula I wherein R<sub>1</sub> is different from hydrogen can be prepared from the corresponding compound I wherein R<sub>1</sub> represents hydrogen by conventional reactions, widely used in organic chemistry. The compounds of formula I wherein R<sub>1</sub> is halogen can be prepared from the corresponding compound I wherein R<sub>1</sub> represents hydrogen by treatment with a suitable halogenating agent such as an N-halosuccinimide or Br<sub>2</sub> when X = N, and by treatment with a strong base such as butyllithium to generate an anion and subsequent reaction with a suitable halogenating agent such as an N-halosuccinimide when Y = N. Other examples of transformations include: the treatment of a compound of formula I wherein Y = N with a strong base such as butyllithium to generate an anion preferentially at position 2 of the imidazole, and subsequent reaction with an electrophilic reagent such as a suitable alkylating agent, for example methyl iodide, a suitable acylating agent (to give a compound I wherein R<sub>1</sub> = -COCH<sub>3</sub>), tosylcyanide (to give a compound I wherein R<sub>1</sub> = cyano) or dimethylformamide (to give a compound I wherein R<sub>1</sub> = CHO); the acylation by treatment with an acetyl chloride in the presence of a base such as triethylamine to give a compound I wherein R<sub>1</sub> = -COCH<sub>3</sub>; the nitration by treatment with a suitable nitration reagent such as HNO<sub>3</sub>/H<sub>2</sub>SO<sub>4</sub>; the transformation into a -CHO or -COOR<sub>4</sub> group by treatment with formaldehyde to give the hydroxymethyl derivative (-CH<sub>2</sub>OH) and subsequent oxidation thereof to give an aldehyde or an ester.

**[0058]** Other transformations between substituents R<sub>1</sub> include: the transformation of a halogen into a variety of substituents by treatment with a base such as butyllithium to give an anion which will react with suitable electrophilic reagents such as those above described; the transformation of a halogen atom, for example chloro, into a hydrogen atom by hydrogenation in the presence of a catalyst such as Pd/C in a suitable solvent such as an alcohol; the hydrolysis of an ester group under the usual conditions, for example by treatment with a base, to give a carboxy group, which can be removed by decarboxylation by treatment with an acid such as H<sub>2</sub>SO<sub>4</sub> at reflux; the transformation of a -CHO group into a cyano group by treatment with hydroxylamine-O-sulfonic acid at reflux.

**[0059]** Likewise, new compounds of formula I can be prepared by transformations between the substituents of the group R<sub>2</sub>. As examples of these transformations we can mention the following: the reduction of a nitro group to give an amino group, for example by hydrogenation in the presence of a suitable catalyst such as Pd/C or by treatment with a suitable reducing agent such as SnCl<sub>2</sub>; the reaction of an amino group with a sulfonyl halide (HalSO<sub>2</sub>R<sub>5</sub>) to give the corresponding sulfonamide (-NR<sub>4</sub>SO<sub>2</sub>R<sub>5</sub>); the acylation of an amino group by treatment with a suitable acylating reagent such as an acid halide or an anhydride; the alkylation of an amino group by treatment for example with a suitable alkylating agent; the reductive amination of an amino group with a ketone to give an alkyl- or dialkylamino group; the hydrogenolysis of a mono- or di-benzylamine by hydrogenation in the presence of a suitable catalyst such as Pd/C, to give the corresponding amine; the transformation of a hydrogen atom into a sulfonyl halide, for example sulfonyl chloride

(-SO<sub>2</sub>Cl), by treatment with a halosulfonic acid, for example chlorosulfonic acid, and subsequent reaction of the resulting halosulfonyl group with an amine (NHR<sub>4</sub>R<sub>6</sub>) to give the corresponding sulfonamide (-SO<sub>2</sub>NR<sub>4</sub>R<sub>6</sub>); the transformation of an amino group into a sulfonyl halide (-SO<sub>2</sub>Hal), by treatment with SO<sub>2</sub> in the presence of CuCl<sub>2</sub>, which is transformed into a sulfonamide (-SO<sub>2</sub>NR<sub>4</sub>R<sub>6</sub>) by treatment with the corresponding amine NHR<sub>4</sub>R<sub>6</sub>; the oxidation of a thioether group with a suitable oxidizing agent to give a -SOR<sub>5</sub> or -SO<sub>2</sub>R<sub>5</sub> group.

[0060] This type of reactions are widely described in the literature and are carried out under the standard conditions used in organic chemistry for this kind of transformations. Some of them are illustrated in the examples.

[0061] All these interconversion reactions between substituents can be performed upon the final compounds as well as upon any of their synthetic intermediates.

[0062] The aldehydes of formulae IV and VI and the amines of formulae V, VII and XII are commercially available, are widely described in the literature or can be prepared by methods analogous to those described starting from commercially available products. For example, an aldehyde of formula IV or VI can be prepared from the corresponding carboxylic acid in a sequence which comprises the transformation into an ester, for example an ethyl ester, under the usual conditions of ester formation, subsequent reduction of the ester to the alcohol with a suitable ester reducing agent such as lithium aluminum hydride, and finally oxidation of the alcohol to the aldehyde with a suitable oxidizing agent such as dimethylsulfoxide/oxalyl chloride.

[0063] The salts of the compounds of formula I can be prepared by conventional methods by treatment for example with an acid such as hydrochloric acid, sulfuric acid, nitric acid, oxalic acid or methanesulfonic acid.

[0064] As it has been mentioned above, the compounds of the present invention act by inhibiting the cyclooxygenase-2 enzyme (COX-2). Therefore, they are useful for the treatment or prevention of inflammation, pain and/or fever associated with a wide range of diseases or pathologies, which include among others: rheumatic fever; symptoms associated with influenza or other viral infections; common cold; low back and neck pain; dysmenorrhea; headache; toothache; myositis; neuralgia; synovitis; bursitis; arthritis, including rheumatoid arthritis and juvenile arthritis; degenerative joint diseases, including osteoarthritis; gout and ankylosing spondylitis; lupus erythematosus; tendinitis; sprains, strains and other similar injuries, such as those occurred during sport performance; pain following surgical or dental procedures; and pain associated with cancer. They are also useful in the treatment of skin inflammatory diseases, including psoriasis, eczema, burns and dermatitis.

[0065] The compounds of the present invention can also be useful for the treatment of other pathologies mediated by COX-2. For example, the compounds of formula I can inhibit cell proliferation and consequently they can be useful for the treatment or prevention of cancer, specially of cancers that produce prostaglandins or that express cyclooxygenase. The compounds of the invention are useful for the treatment, for example, of liver, bladder, pancreas, ovary, prostate, cervix, lung, breast and skin cancer, and specially gastrointestinal cancers such as colon cancer.

[0066] The compounds of the present invention can also inhibit prostanoid-induced smooth muscle contraction and thus can be useful for the treatment of dysmenorrhea, preterm labour, asthma and bronchitis. Other uses of the compounds of formula I include the treatment or prevention of cerebral infarction, epilepsy, and neurodegenerative diseases, such as Alzheimer's disease and dementia.

[0067] Likewise, the compounds of the present invention can be used for treating inflammation in diseases such as vascular diseases, migraine, periarteritis nodosa, thyroiditis, aplastic anaemia, Hodgkin's disease, scleroderma, type I diabetes, myasthenia gravis, sarcoidosis, nephrotic syndrome, Behçet's syndrome, polymyositis, hypersensitivity, conjunctivitis, gingivitis and myocardial ischaemia.

[0068] Due to their selectivity for cyclooxygenase-2, the compounds of the present invention are useful as an alternative to non-steroidal anti-inflammatory drugs (NSAIDs), specially in those cases in which NSAIDs may be contraindicated.

[0069] According to the activity of the products herein described, the present invention also relates to compositions which contain a compound of the present invention, together with an excipient or other auxiliary agents if necessary. The compounds of the present invention can be administered in the form of any pharmaceutical formulation, the nature of which, as it is well known, will depend upon the route of administration and the nature of the pathology to be treated.

[0070] According to the present invention, solid compositions for oral administration include tablets, powders for extemporaneous suspensions, granulates and capsules. In tablets, the active component is admixed with at least one inert diluent such as lactose, starch, mannitol, microcrystalline cellulose or calcium phosphate; with a binding agent such as for example starch, gelatin, microcrystalline cellulose or polyvinylpyrrolidone; and with a lubricating agent, such as for example magnesium stearate, stearic acid or talc. Tablets can be coated by known techniques with the purpose of delaying their disintegration and absorption in the gastrointestinal tract, and thereby provide a sustained action over a longer period. Gastric or enteric coatings can be made with sugar, gelatin, hydroxypropylcellulose, acrylic resins, etc. Sustained-release tablets might also be obtained using an excipient which produces regressive osmosis, such as the galacturonic acid polymers. Preparations for oral use can also be presented as hard capsules of absorbable material, such as for example gelatin, wherein the active compound is mixed with an inert solid diluent and lubricating agents, or pasty materials, such as ethoxylated saturated glycerides, which might also provide controlled release. Soft

gelatin capsules are also possible, wherein the active compound is mixed with water or an oily medium, for example coconut oil, liquid paraffin, or olive oil.

**[0071]** Powders and granulates for the preparation of suspensions by the addition of water can be obtained by mixing the active compound with dispersing or wetting agents; suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth, xanthan gum, gum acacia, and one or more preservatives, such as methyl or propyl *p*-hydroxybenzoate. Other excipients can also be added, for example sweetening, flavouring and colouring agents.

**[0072]** Liquid forms for oral administration include emulsions, solutions, suspensions, syrups and elixirs containing commonly-used inert diluents, such as distilled water, ethanol, sorbitol, glycerol or propylene glycols. Said compositions can also contain coadjuvants such as wetting, suspending, sweetening, flavouring, preserving agents and buffers.

**[0073]** Injectable preparations, according to the present invention, for parenteral administration, comprise sterile aqueous or non-aqueous solutions, suspensions or emulsions, in a suitable non-toxic solvent or diluent. Examples of aqueous solvents or suspending media are distilled water for injection, Ringer's solution and isotonic sodium chloride solution. As non-aqueous solvents or suspending media propylene glycol, polyethylene glycol, vegetable oils such as olive oil, or alcohols such as ethanol can be used. These compositions can also contain coadjuvants, such as wetting, preserving, emulsifying and dispersing agents. They may be sterilized by any known method or prepared as sterile solid compositions which will be dissolved in water or any other sterile injectable medium immediately before use. It is also possible to start from sterile materials and keep them under these conditions throughout all the manufacturing process.

**[0074]** The dosage and frequency of doses will depend upon the nature and severity of the disease to be treated, the age and body weight of the patient, as well as the route of administration. In general, the daily dose for an adult will be comprised between 1 and 1000 mg per day, which can be administered as a single or divided doses. However, in special cases, doses outside these margins might be necessary. A person skilled in the art will be able to easily determine the suitable dose for each situation.

**[0076]** The activity of the compounds of the present invention can be determined using the following tests:

Inhibition of cyclooxygenase-1 (COX-1) and cyclooxygenase-2 (COX-2) activity in human blood

**[0077]** Heparinized human blood from healthy volunteers who had not taken non-steroidal anti-inflammatory drugs

(NSAIDs) for a week, and neither alcohol nor xanthines 24 h before blood collection, is used. Blood is divided into two groups; one will be used to determine COX-1 activity and the other one for COX-2. The procedure to follow will be different in each case.

**[0078]** For COX-1, 12-mL tubes are used. 5  $\mu$ L of the test compound (in DMSO solution; in duplicate) are placed in each tube. Additionally two tubes for blanks and two tubes for controls containing 5  $\mu$ L of DMSO are used. Next, 1 mL of blood is added to each tube and they are stirred. The tubes are placed in a thermostated bath at 37 °C for 5 h. Then, 5  $\mu$ L of 5 mM ionophore A23187 is added to each tube, except to the blanks, and tubes are incubated for 30 min more at 37 °C. After this time, the tubes are placed in ice and 100  $\mu$ L of a 100 mM EGTA solution is added to stop the reaction. 2.5 mL of methanol is added to each tube to reach a final concentration of 70 %. The tubes are stirred and frozen at -70 °C till their use. The COX-1 activity is determined by measuring thromboxane B<sub>2</sub> levels in the samples. Blood is defrozen and centrifuged at 2000 g for 10 min at 4 °C. 1 mL of supernatant is evaporated under nitrogen to dryness. The solid residue thus obtained is resuspended in 1 mL of saline and the thromboxane B<sub>2</sub> levels in these samples are determined using a kit (Kit Thromboxane B<sub>2</sub>, Biotrak EIA system RPN220 Amershan), according to the manufacturer's instructions.

**[0079]** For COX-2, 3-mL tubes are prepared in duplicate containing 5  $\mu$ L of the test compound (solution in DMSO) and 5  $\mu$ L of vehicle in the case of blanks and controls. To each tube, 5  $\mu$ L of a 2 mg/mL solution of aspirin in DMSO is also added (in order to inhibit COX-1 activity), and to all tubes except the blanks 5  $\mu$ L of LPS is also added (in order to induce COX-2 activity). Finally, 1 mL of heparinized blood is added to each tube, and tubes are then stirred and placed in a thermostated bath at 37 °C for 24 h. Then, tubes are centrifuged at 2000 g for 10 min at 4 °C, the resulting plasma is collected and is frozen at -70 °C until use. COX-2 activity is determined by measuring prostaglandin E<sub>2</sub> levels in the samples. The plasma stored at -70°C is defrozen and prostaglandin E<sub>2</sub> levels in these samples are determined using a kit (Kit Prostaglandin E<sub>2</sub>, Biotrak EIA system RPN222 Amershan), according to the manufacturer's instructions.

**[0080]** The results obtained with representative compounds of the present invention are shown in the following table, where the % inhibition of COX-1 and COX-2 activities at a concentration of 10 or 1  $\mu$ M of test compound is given, as indicated.

**[0101]** A mixture of 27.2 g (86 mmol) of 5-(4-fluorophenyl)-1-(4-methylsulfonylphenyl)imidazole (obtained in example 1), 12.05 g (90 mmol) of N-chlorosuccinimide and 81 mL of CHCl<sub>3</sub> was refluxed for 18 h. The solvent was removed and the residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with 1 N HCl and next with 1 N NaOH and brine. The organic phase was dried over MgSO<sub>4</sub> and concentrated. The crude product obtained was washed with Et<sub>2</sub>O several times to afford 26.2 g of a creamy solid, which was chromatographed on silica gel, using EtOAc-hexane mixtures of increasing polarity as eluent. The title compound of the example was obtained as a white solid (24.0 g, 80 %).
